

Objective

The objective of this project is to develop a simple Python-based application that determines whether a given number is **even or odd**. The application uses the modulus (%) operator to check the remainder when a number is divided by 2. A **Streamlit-based interface** is used to provide an interactive local web application where users can enter numbers and view the result instantly.

Key Features

- Checks whether the entered number is **even or odd**.
- Uses the **modulus (%) operator** for number classification.
- Supports **positive, negative, and zero values**.
- Provides an interactive **Streamlit web interface**.
- Displays clear messages for both **Even Number** and **Odd Number** results.
- Provides example inputs to demonstrate both even and odd outputs.
- Runs locally through a **localhost web application**.
- Uses conditional statements to determine the result.

Technologies Used

- **Python** – Used as the primary programming language.
- **Streamlit** – Used to create the interactive web interface.
- **Modulus Operator (%)** – Used to determine whether a number is divisible by 2.
- **Conditional Statements (if-else)** – Used to classify the input as even or odd.
- **Git & GitHub** – Used for source-code version control and project submission.
- **Localhost** – Used to run and test the Streamlit application locally.

```
1 import streamlit as st
2
3
4 st.set_page_config(
5     page_title="Even or Odd Checker",
6     page_icon="🎲"
7 )
8 st.title("🎲 Even and Odd Number Checker")
9 st.write("Enter a number to check whether it is even or odd.")
10
11 number = st.number_input(
12     "Enter a number:",
13     value=0,
14     step=1
15 )
16
17 if st.button("Check Number"):
18     if number % 2 == 0:
19         st.success(f"🎉 {int[number]} is an Even Number.")
20     else:
21         st.warning(f"⚠️ {int[number]} is an Odd Number.")
22
23 st.divider()
24
25 st.subheader("Examples")
26
27 col1, col2 = st.columns(2)
28
29 with col1:
30     st.info("Even Number Example")
31     st.write("Input: **10**")
32     st.success("10 is an Even Number.")
33
34
35 with col2:
36     st.info("Odd Number Example")
37     st.write("Input: **7**")
38     st.warning("7 is an Odd Number.")
```

OUTPUT

12

34

Even and Odd Number Checker

Enter a number to check whether it is even or odd.

Enter a number:

Check Number

🎲 10045 is an Odd Number.

Examples

Even Number Example

Odd Number Example

Input: 10

10 is an Even Number.

Input: 7

7 is an Odd Number.

[illegible]

The image is a composite of two screenshots. The left screenshot shows a web browser window with the address bar displaying 'localhost:8501'. The page title is 'Even or Odd Checker'. The main content area has a dark background with a light blue header that says 'Even and Odd Number Checker'. Below the header, there is a text input field containing the number '10045', a 'Check Number' button, and a green feedback message that says '10045 is an Odd Number'. There is also an 'Examples' section with two buttons: 'Even Number Example' and 'Odd Number Example'. The right screenshot shows a social media post from a user named 'Shambhavi E L' who is a student at The Oxford College. The post is titled 'Day 3 of my VEDA Internship!' and contains the text: 'Today, I developed an Even or Odd Number Checker using Python. This task helped me strengthen... more'. Below the text are icons for 'Like', 'Comment', 'Repost', and 'Send'. At the bottom, there is a comment input field with the placeholder text 'Add a comment...' and icons for emojis, GIFs, and image uploads.
